Why the coast is important

- Coastal zone is an extremely dynamic and complex environment
- There are continuous interactions occurring – many of these are driven by surface winds and ocean waves
- 40-60% of the population is concentrated along the coast – this number is constantly on the rise, resulting in an increase:
 - in population density ,
 - associated socio-economic activities and
 - economic opportunity within the coastal zone;

Therefore, more and more people are being exposed to the ocean and the impacts of ocean waves

Ocean wave hazards

Ocean Wave Characteristics

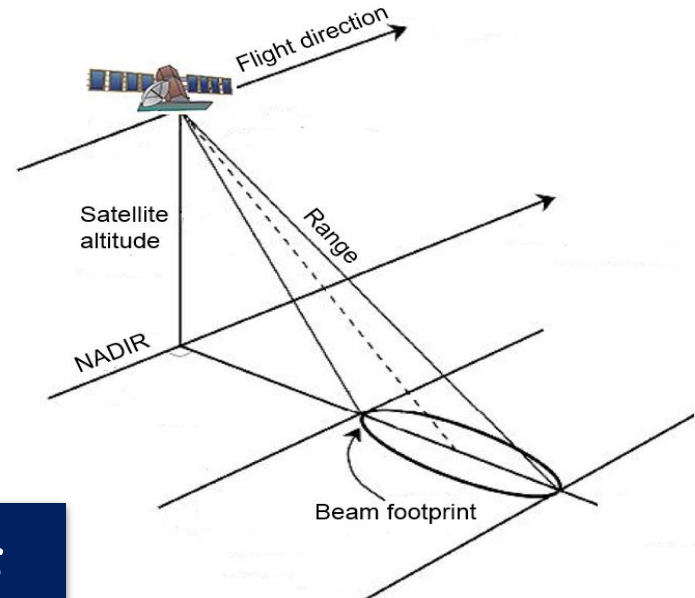

- In order to protect and plan, good understanding of waves, their energy and characteristics is needed

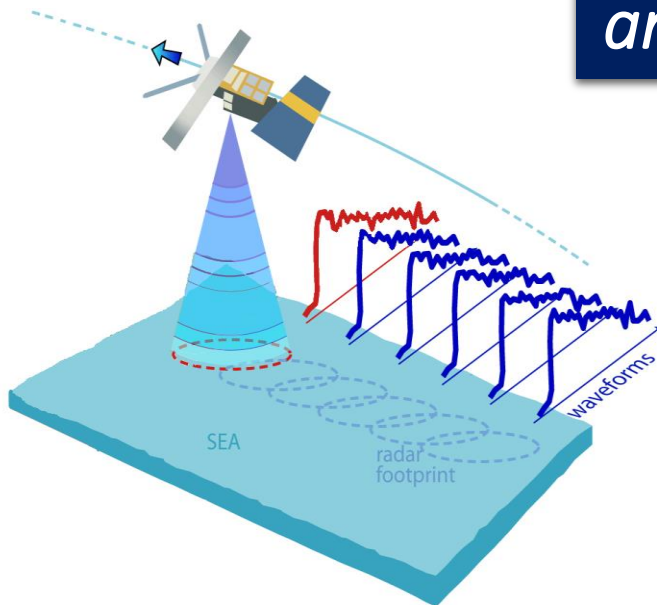

In-situ instruments

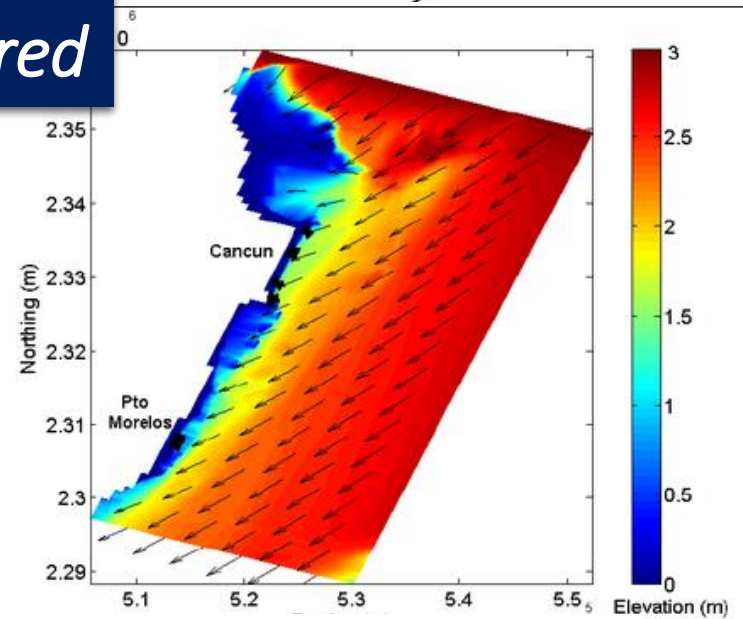

Synthetic Aperture Radar

How waves are measured

Satellite Radar Altimetry

Wave Models

Aim of this research

Extract wave characteristics such as:

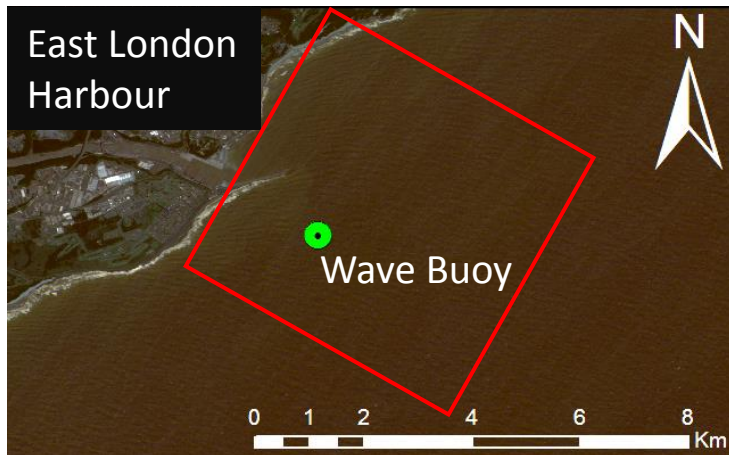

- Wave direction
- Wavelength
- Wave period
- Wave phase velocity

Approach 1: Extract 2D wave spectra using FFT for single band image

Approach 2: Extract phase velocity field from two single band images

Study areas

Approach 1: Extracting the wave spectra

Sea state

Number of harmonic wave components

Approach 1: Extracting the wave spectra

Fast Fourier Transform the NIR image

NIR band

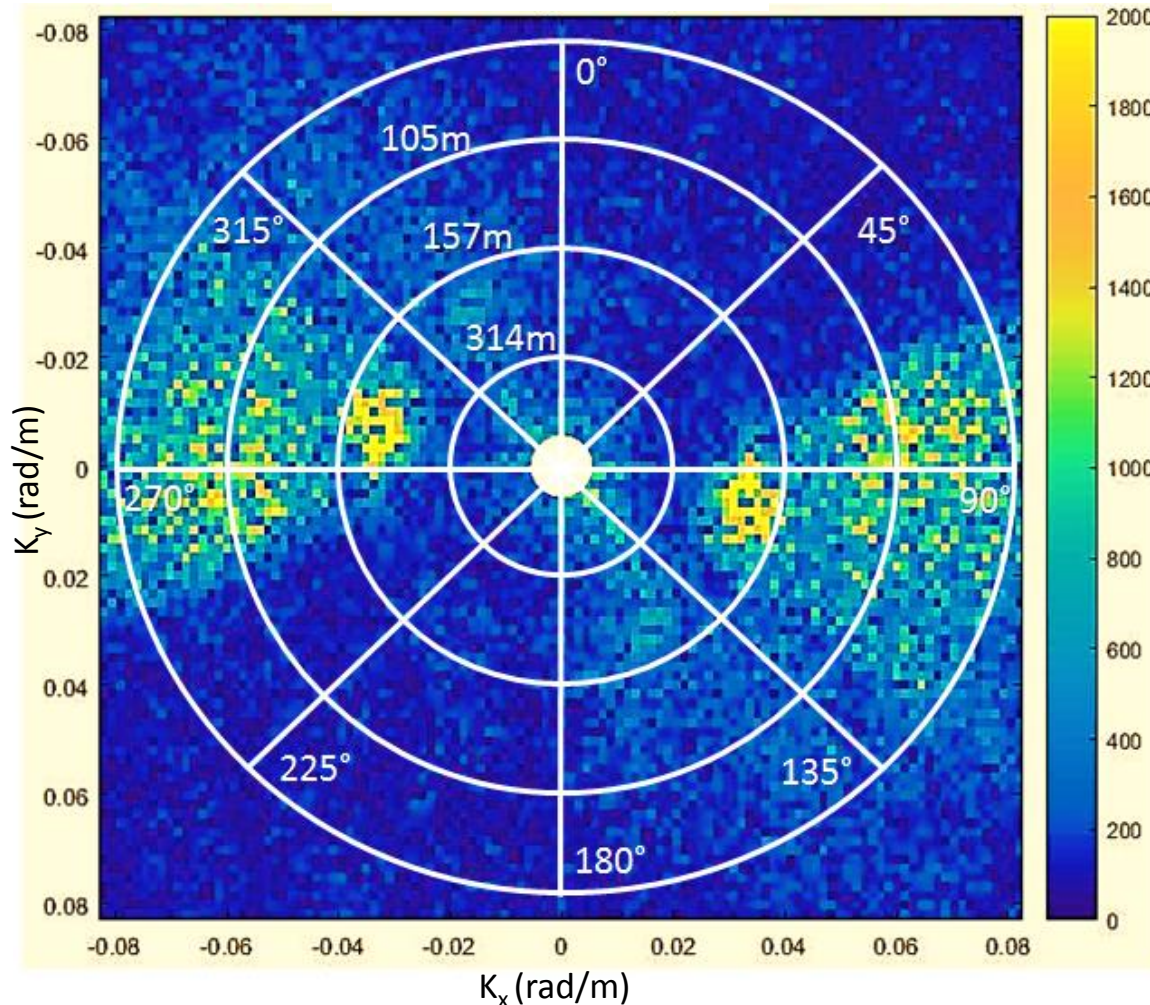

2-D image spectrum

Approach 1: Extracting the wave spectra

2-D image spectrum

Wavelength
 $\frac{2\pi}{\sqrt{K_x^2 + K_y^2}}$

Wave Direction
 $\arctan\left(\frac{K_y}{K_x}\right)$

Approach 1: Extracting the wave spectra

2-D image spectrum

Wavelength
 $\frac{2\pi}{\sqrt{K_x^2 + K_y^2}}$

Wave Direction
 $\arctan\left(\frac{K_y}{K_x}\right)$

Parameters derived from Buoy

Wavelength = 202m
Wave direction = 106°

Approach 1: Extracting the wave spectra

2-D image spectrum

Wavelength

$$\frac{2\pi}{\sqrt{K_x^2 + K_y^2}}$$

Wave Direction

$$\arctan\left(\frac{K_y}{K_x}\right)$$

Parameters derived from spectrum

Wavelength = 197.1m
Wave direction = 105.2°

Parameters derived from Buoy

Wavelength = 202m
Wave direction = 106°

Approach 2: Extracting phase velocity field from RapidEye

Approach 2: Extracting phase velocity field from RapidEye

Approach 2: Extracting phase velocity field from RapidEye

Normalised cross correlation using CIAS software

Direction at buoy location
Waverider Buoy 106°
Phase Velocity Field 104°

Conclusions

- Coastal wave direction, wavelength and phase velocity can be extracted from RE imagery (full validation pending)
- This could provide valuable input for understanding large scale near-shore wave characteristics
 - Used coastal modelling, protection & planning
- Way forward
 - Apply to other three study sites
 - Perform full accuracy assessment

Thank You
